

It seems the need to provide internet coverage via BPL has taken the present commissioners by storm (I thought they were a neutral body). The interference that this service will cause to radio frequencies has been proven in Europe as well as Japan. The frequencies most affected are used by not only private entities but government installations as well. If the FCC Commissioners would logically investigate the benefits vs. liabilities in this matter, I believe they would come to the conclusion that there is no need for this service. Presently, high speed internet service is available to anyone who needs or wants it. The argument that this will provide high speed service to the poor lacks merit. I think the Commissioners would do well to visit some poor areas to see how many of those individuals even have computers let alone "56K dial-up".

Since 9-11-01 the President has asked all of us to do our part for homeland security. Destroying the usability of the nations coast to coast back-up communications frequencies for the sake of a service that is already available is not only irresponsible but could prove dangerous. PLEASE THINK LONG AND HARD ON THIS ISSUE.
